

Application No. 10/806,194

IN THE ABSTRACT:

Please enter the attached Substitute Abstract of the Disclosure for that originally filed with this application.

ABSTRACT OF THE DISCLOSURE

A mini Secure Digital (SD) card connector includes an insulation body, a pair of clamping arms and eleven insertion terminals. The insulation of the connector has an open recess and a protective structure, and is for accommodating a signal contact portion of the mini SD card. To appropriately place the signal contact portion in correct directions, the insulation further has retaining ribs for retaining guiding track portions of the mini SD card, and block members of the clamping arms for fastening with breaches of the mini SD card, thereby steadily locating the mini SD card in the open recess of the insulation body of the connector.
